MACROECONOMIC CONDITIONS FOR THE INTRODUCTION OF RENEWABLE ENERGY SOURCES IN POLAND

Development of renewable energy is essential for achieving the main objectives of the climate and energy policy. Increasing the use of renewable energy opens up new possibilities for reducing CO₂ emissions and to improve energy efficiency. Polish renewable energy sector is one of the fastest growing areas of the economy over the past few years. Creation of national regulatory bodies to implement the appropriate procedures has been proposed, which, on the one hand, will stimulate operators to invest in the renewable energy sector (a positive impact on economic development), and on the other hand, provide a means to monitor the progress of work on the development of equipment.

Stability and sustainable economic development enhances the credibility of the economic policy of the state. It also leads to an increase in the interest of investors both domestic and external. Polish economic situation in comparison with other EU countries remains favorable. Poland is one of the fastest growing countries in Europe. The macroeconomic situation of the Polish economy, including the state of the domestic and economic relations, gives a good chance to achieve its obligations related to the implementation of renewable energy sources.
